Mohammad Faza Akmal (12173903), Project Management Information System Program Design at PT. MADANI KREATIF TEKNOLOGI

Project Management Information System Design is the result of the development of computer application technology which will be expected to help and facilitate the company's operational activities in project management. In this case the problem that occurred at PT. Madani Creative Technology is already in possession of project management but still uses Microsoft Excel and company diaries, which still often results in delays in project work and miss communication because the projects being undertaken are not well managed. The research method used in this study uses the waterfall software development method. This website design starts from making program design in the form of Entity Relationship Diagram with seven supporting tables, along with Logical Record Structures, Navigation Structure consisting of Administrators, Managers, Employees and Accounting, to program testing which is carried out to adjust the application whether it is easy to use or not and to check whether the system runs according to orders or not based on preferences and respondents. The making of this program uses Dreamweaver CS3 as a text editor, XAMPP Version 7 as a local server and PHPMyAdmin. With this website it is expected to provide convenience to PT. Madani Kreatif Technology in project management or project management so that in every project work can be managed properly and on time.
