

ABSTRACT

Saepur Rohim (12190239), Designing a used car sales information system at Botomotif Jakarta

The author made this final project based on the sale of Botomotif Jakarta. Botomotif Jakarta is a company engaged in the sale of used cars. With the development of Botomotif Jakarta, which is marked by the increasing number of sales transactions, there are problems with the system which is still done manually. So it is necessary to create an application system that is useful to be able to handle problems that arise or at least reduce the level of errors that occur during the sales process. For this reason, the author designed a computerized processing system starting from the vehicle ordering process, the payment process for the down payment to the report generation process. All of that the author pours in a title of Information System Design for used car sales on botomotif Jakarta.

Keywords: System design, Sales System
